

SARVAM AI × SUNRISE FINANCE (NBFC) - PRE-SALES PROOF OF CONCEPT

Meet Priya

A multilingual voice collections agent - built on India's own AI

22+ Indian languages,
code-mixing native

Data resident in India,
on-prem deployable

Voice-first - no app,
no literacy barrier

Collections in India runs on voice - and it is expensive

₹ ₹80-100 cost per human collection call (agent, telephony, supervision)

📞 50M+ collection calls placed monthly across Indian lenders

🔄 3-5 attempts needed per overdue account, every cycle

The real constraint is people

- Hiring & attrition - collection floors churn 40%+ a year
- Language coverage stops at metro languages
- Off-script calls create RBI Fair Practices risk
- Volume spikes on due dates; capacity is fixed

Why Sarvam: India's own AI stack

SARVAM AI

GENERIC GLOBAL STACK

Language

22+ Indian languages; Hinglish & Tanglish code-mixing handled natively by Saarika STT + Bulbul TTS

English-first models; code-mixed speech is brittle, Indian accents degrade accuracy

Data residency

Models built and hosted in India; aligned with DPDP Act 2023 & RBI data-localisation expectations

Offshore inference; cross-border transfer reviews for every borrower conversation

Deployment

Public API today; on-premise / private-VPC options for regulated BFSI workloads

Cloud-only in most cases; on-prem rarely on the table

Sovereignty

India's foundational-model builder under the IndiaAI Mission - rupee-priced, India-supported

Dollar-priced, roadmap and support driven by other markets

What we built: voice bot + agentic workflow (A+B)

Built 100% no-code in n8n Cloud • every AI step is a Sarvam public API • customer audio simulates the telephony stream (Plivo / LiveKit in production)

Live demo: two calls, one workflow

CALL 1 — HINGLISH

Rajesh Kumar • EMI ₹8,450

Hindi–English code-mix

Lost his job - cannot pay right now. Priya detects hardship, responds with empathy and options.

CRM: hardship • escalated to senior officer

CALL 2 — TANGLISH

Muthu • EMI ₹9,000

Tamil–English code-mix

Salary delayed - commits to pay on 15 July. Priya confirms the date and sends a payment link.

CRM: promise-to-pay • 15 Jul 2026 captured

Between the calls, only the CRM record changes - the pipeline is untouched.

The business case

Assumptions (mid-size NBFC)

- 2,00,000 overdue accounts / month × 3 attempts = 6,00,000 calls
- Human agent: ₹80 per call, fully loaded
- Priya: ~₹6 per call, blended Sarvam STT + LLM + TTS (~2-min call)
- 70% of Tier-1 calls automated; hardship & disputes stay human

₹3.1 Cr

saved per month (~65% cost reduction, ₹37+ Cr annualised)

Before counting recovery-rate uplift from day-one, every-language outreach.

Honest limitations — and a 90-day path to production

What this PoC is not (yet)

- Telephony is simulated with recorded audio — no live calls yet
- Single exchange per call — no long multi-turn memory
- No identity verification before discussing loan details — mandatory for production BFSI
- Google Sheets stands in for the real CRM / LMS

DAYS 0–30 — PILOT

Live telephony (Plivo / LiveKit + Sarvam streaming), identity verification, one language, one loan product

DAYS 31–60 — DEEPEN

Multi-turn memory, CRM / LMS integration, payment-gateway links, three languages, human hand-off desk

DAYS 61–90 — SCALE

On-prem / private-VPC deployment for data sovereignty, QA dashboards, RBI-ready audit trails, all-language rollout

Each step is an integration, not a redesign — the Sarvam pipeline you just saw stays the same.
